The article identifies the main areas of research in the field of enveloping intelligence systems that are relevant at the present stage of world development. Brief results of the review of the “smart technologies” market are presented, trends in the application of decision-making systems in the field of agriculture are noted. The issue of increasing labor productivity in agricultural production through automation and the introduction of robotics is being actualized. As a result of the study, it was found that farms of various types have a need to automate the harvesting process, which led to further directions of analysis. An overview of the current state of the world agricultural robot market is presented and its key players are identified.

Keywords: intelligent habitats, digital transformations, digital field, multi-agent self-organization processes, agriculture, automation and robotization of agricultural production; labor productivity.
